Subject: Drought Monitoring Photos - Little Klickitat River

The Little Klickitat River downstream of the City of Goldendale is now dry throughout significant reaches with the exception of a series of pools connected with hyporheic flow. Numerous *O. mykiss* (rainbow trout/steelhead) of various age classes are concentrated within the pools ranging in size from fry to about 12 inches in length. Between Goldendale and Brooks Memorial State Park the stream flow is a fraction of a cfs (maybe 15gpm?). The stream is mostly dry upstream of the SR97 crossing on Satus Pass.
